

```
knitr::opts_chunk$set(echo = TRUE)
nsims <- 100000 #set number of simulations
library(mvtnorm)
library(afex)
library(emmeans)
library(ggplot2)
library(gridExtra)
library(reshape2)
```

Validation of Power in Repeated Measures ANOVA

We first repeat the simulation by Brysbaert:

```
# give sample size
N = 75

# give effect size d
d1 = .4 #difference between the extremes
d2 = .4 #third condition goes with the highest extreme

# give the correlation between the conditions
r = .5

# give number of simulations
nSim = nsims

# give alpha levels
alpha1 = .05 #alpha level for the omnibus ANOVA
alpha2 = .05 #also adjusted from original by DL

# create progress bar in case it takes a while

# create vectors to store p-values
p1 <- numeric(nSim) #p-value omnibus ANOVA
p2 <- numeric(nSim) #p-value first post hoc test
p3 <- numeric(nSim) #p-value second post hoc test
p4 <- numeric(nSim) #p-value third post hoc test

# open library MASS
library('MASS')

# define correlation matrix
rho <- cbind(c(1, r, r), c(r, 1, r), c(r, r, 1))

# define participant codes
part <- paste("part", seq(1:N))

for(i in 1:nSim){ #for each simulated experiment
  # setWinProgressBar(pb, i, title=paste(round(i/nSim*100, 1), "% done"))
  data = mvnrm(n=N, mu=c(0, 0, 0), Sigma=rho)
  data[,2] = data[,2]+d1
  data[,3] = data[,3]+d2
```

```

datalong = c(data[,1],data[,2],data[,3])
conds= factor(rep(letters[24:26], each = N))
partID = factor(rep(part, times = 3))
output <-data.frame(partID,conds,datalong)
test <- aov(datalong~conds + Error(partID/conds), data=output)
tests <- (summary(test))
p1[i] <- tests$'Error: partID:conds'[[1]]$'Pr(>F)'[[1]]
p2[i] <- t.test(data[,1],data[,2], paired=TRUE)$p.value
p3[i] <- t.test(data[,1],data[,3], paired=TRUE)$p.value
p4[i] <- t.test(data[,2],data[,3], paired=TRUE)$p.value
}
#close(pb)#close progress bar

#printing all unique tests (adjusted code by DL)
sum(p1<alpha1)/nSim

```

```
## [1] 0.95236
```

```
sum(p2<alpha2)/nSim
```

```
## [1] 0.92702
```

```
sum(p3<alpha2)/nSim
```

```
## [1] 0.92803
```

```
sum(p4<alpha2)/nSim
```

```
## [1] 0.04996
```

Installation

We install the functions:

```
# Install the two functions from GitHub by running the code below:
```

```

source("https://raw.githubusercontent.com/Lakens/ANOVA_power_simulation/master/ANOVA_design.R")
source("https://raw.githubusercontent.com/Lakens/ANOVA_power_simulation/master/ANOVA_power.R")

```

Reproducing Brysbaert

We can reproduce the same results as Brysbaert finds with his code:

```

string <- "3w"
n <- 75
mu <- c(0, 0.4, 0.4)
sd <- 1
r <- 0.5
p_adjust = "none"
labelnames <- c("speed", "fast", "medium", "slow")

```

We create the within design, and run the simulation

```

design_result <- ANOVA_design(string = string,
                             n = n,
                             mu = mu,

```

Figure 1:

```
sd = sd,
r = r,
p_adjust = "none",

labelnames = labelnames)
```

```
ANOVA_power(design_result, nsims = nsims)
```

```
## Power and Effect sizes for ANOVA tests
##           power effect size
## anova_speed 95.09      0.1033
##
## Power and Effect sizes for contrasts
##           power effect size
## p_speed_fast_speed_medium 92.653      0.4035
## p_speed_fast_speed_slow   92.699      0.4036
## p_speed_medium_speed_slow  4.957      0.0002
```

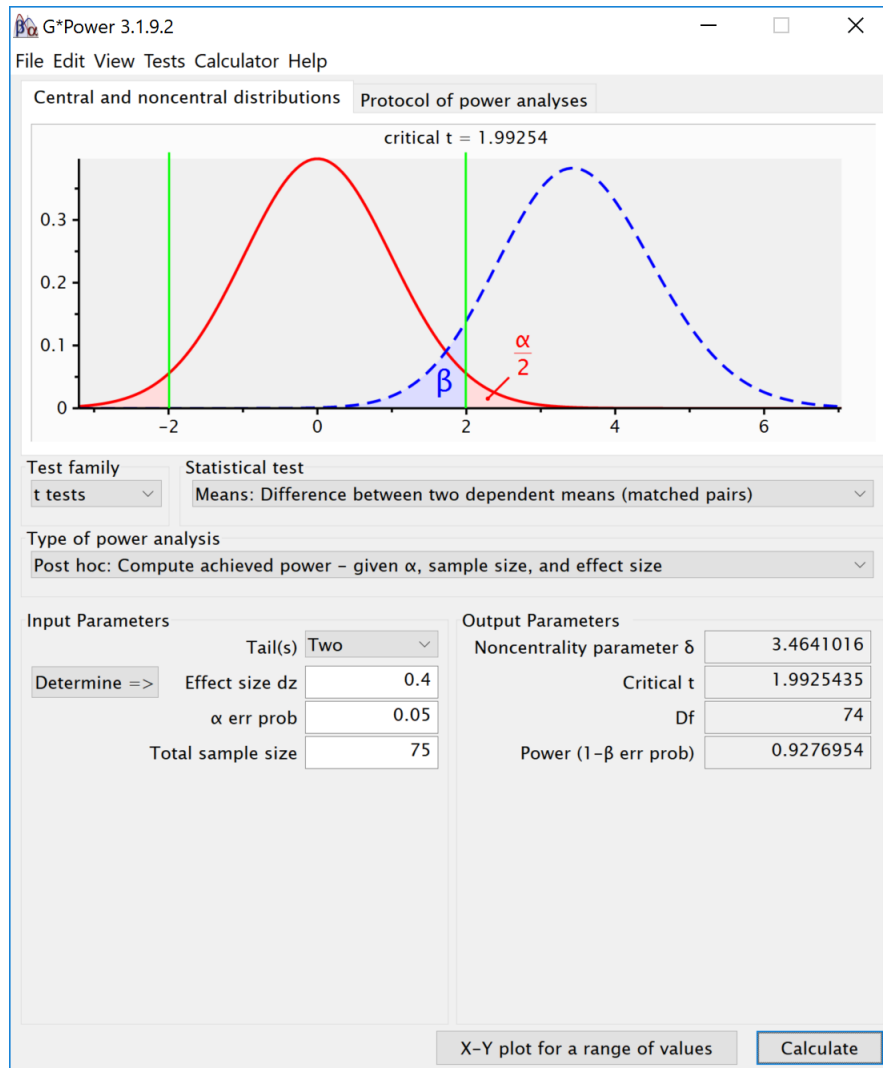

Figure 2:

Results

The results of the simulation are very similar. Power for the ANOVA F -test is around 95.2%. For the three paired t -tests, power is around 92.7. This is in line with the a-priori power analysis when using g*power:

We can perform an post-hoc power analysis in G*power. We can calculate Cohen's f based on the means and sd , using our own custom formula.

```
# Our simulation is based on the following means and sd:
# mu <- c(0, 0.4, 0.4)
# sd <- 1

f <- sqrt(sum((mu - mean(mu))^2) / length(mu)) / sd #Cohen, 1988, formula 8.2.1 and 8.2.2
# We can see why f = 0.5*d.
# Imagine 2 group, mu = 1 and 2
# Grand mean is 1.5, we have sqrt(sum(0.5^2 + 0.5^2) / 2), or sqrt(0.5/2), = 0.5.
# For Cohen's d we use the difference, 2 - 1 = 1.
```

The Cohen's f is 0.1885618. We can enter the f (using the default 'as in G*Power 3.0' in the option window) and enter a sample size of 75, number of groups as 1, number of measurements as 3, correlation as 0.5. This yields:

Reproducing Brysbaert Variation 1 Changing Correlation

```
# give sample size
N = 75

# give effect size d
d1 = .4 #difference between the extremes
d2 = .4 #third condition goes with the highest extreme

# give the correlation between the conditions
r = .6 #increased correlation

# give number of simulations
nSim = nsims

# give alpha levels
alpha1 = .05 #alpha level for the omnibus ANOVA
alpha2 = .05 #also adjusted from original by DL

# create progress bar in case it takes a while
#pb <- winProgressBar(title = "progress bar", min = 0, max = nSim, width = 300)

# create vectors to store p-values
p1 <-numeric(nSim) #p-value omnibus ANOVA
p2 <-numeric(nSim) #p-value first post hoc test
p3 <-numeric(nSim) #p-value second post hoc test
p4 <-numeric(nSim) #p-value third post hoc test

# open library MASS
library('MASS')

# define correlation matrix
rho <- cbind(c(1, r, r), c(r, 1, r), c(r, r, 1))

# define participant codes
part <- paste("part",seq(1:N))

for(i in 1:nSim){ #for each simulated experiment
  # setWinProgressBar(pb, i, title=paste(round(i/nSim*100, 1), "% done"))
  data = mvrnorm(n=N, mu=c(0, 0, 0), Sigma=rho)
  data[,2] = data[,2]+d1
  data[,3] = data[,3]+d2
  datalong = c(data[,1],data[,2],data[,3])
  conds= factor(rep(letters[24:26], each = N))
  partID = factor(rep(part, times = 3))
  output <-data.frame(partID,conds,dalong)
  test <- aov(dalong~conds + Error(partID/conds), data=output)
  tests <- (summary(test))
  p1[i] <- tests$'Error: partID:conds'[[1]]$'Pr(>F)'[[1]]
```

Figure 3:

```

  p2[i] <- t.test(data[,1],data[,2], paired=TRUE)$p.value
  p3[i] <- t.test(data[,1],data[,3], paired=TRUE)$p.value
  p4[i] <- t.test(data[,2],data[,3], paired=TRUE)$p.value
}
#close(pb)#close progress bar

#printing all unique tests (adjusted code by DL)
sum(p1<alpha1)/nSim

## [1] 0.9834
sum(p2<alpha2)/nSim

## [1] 0.96852
sum(p3<alpha2)/nSim

## [1] 0.96786
sum(p4<alpha2)/nSim

## [1] 0.04983
string <- "3w"
n <- 75
mu <- c(0, 0.4, 0.4)
sd <- 1
r <- 0.6
p_adjust = "none"
labelnames <- c("speed", "fast", "medium", "slow")

```

We create the within design, and run the simulation

```

design_result <- ANOVA_design(string = string,
                             n = n,
                             mu = mu,
                             sd = sd,
                             r = r,
                             p_adjust = "none",

                             labelnames = labelnames)

ANOVA_power(design_result, nsims = nsims)

```

```

## Power and Effect sizes for ANOVA tests
##           power effect size
## anova_speed 98.368      0.1247
##
## Power and Effect sizes for contrasts
##           power effect size
## p_speed_fast_speed_medium 96.853      0.4516
## p_speed_fast_speed_slow   96.962      0.4521
## p_speed_medium_speed_slow  5.119      0.0005

```

Again, this is similar to g^* power for the ANOVA:

Figure 4:

Figure 5:
